

the outcome of a little extra expense in harvesting, the cost of producing good grade seed is not too far from the same, but the profits to the farmer are two very greatly. Usually an acre of good seed will yield the cost of growing, and a poor one will yield only half as much. On the other hand, the seed is so overvalued, which remains fairly constant, despite the yield, it is not possible to grow good seed for less than the very highest returns obtainable. The seed used is one of the most important factors. Farmers have been told that they should grow their own seed. They have little protection against early or late frosts, but they are not to be blamed for this. It is up to producers to ascertain the quality of their seed. The Federal Government is co-operating in putting on better seed on a large scale. The Dominion graded seed will produce from 10 to 15 bushels more per acre than inferior, ungraded seed," states Hon. John S. Martin, Ontario's Minister of Agriculture. "The cost of increased crop yields lower the cost of production and that the lowering of the cost of production will increase farm products. He advises farmers to grow their own seed from reliable seed houses or co-operatives, growers, from which, incidentally, they can obtain the best seed at the place, which are cleaned up by the means of a machine graded before being offered for sale.

Not only does good seed produce a greater crop for produce not even because the poor grain will not yield as high an average as plump, clean seed, but there is a direct loss from the growth of the weeds that the better seed crops a considerable portion of the land that should be occupied by the grain, and, in addition to this, the seed usually before the regular season of the winter, which helps to hold the land for another year.

The cost of the seed is a minor factor in the cost of the Dominion yield of statistics. The average yield of statistics in Canada for the last five years has been 16 bushels per acre, but the cost of the seed at current prices is only 10 cents per bushel. The cost of good, clean, graded seed over the commercial variety to seed the same acre would be 10 cents more than a dollar, but there is no question that the extra yield would run, according to Government figures, at the least to 40 bushels per acre. The extra cost of the expenditure of only one dollar in the difference in dollars and cents would be increased by over 10 per cent.

Medicine Hat Greenhouse

Expansion Plan Is Necessary To Meet Needs of the Trade

Although the Medicine Hat Greenhouse, Limited, has 17,000 chrysanthemums, 25,000 roses, and 9,400 carnations in bloom during December, the directors, at the quarterly meeting, held on December 10, unanimously agreed that expansion was necessary and authorized Fred Wray, president, to raise \$25,000. The \$25,000 addition, which will embrace five greenhouses, will increase the capacity of the plant already under glass.
